

## TopResponse Threat Advisory

**Release Date:** October 14, 2011.

**Purpose:** The Corero TopResponse team is issuing an advisory, which provides information needed to block known attacks targeting the Microsoft Select Element Remote Code Execution Vulnerability (MS11-081,CVE-2011-1999).

**Corero Products:** Top Layer IPS 5500 E-Series and later.

**Vulnerable Infrastructure:** Microsoft Internet Explorer v8.

**Alert Type:** Critical Vulnerability

**Risk Assessment:** Critical

**Threat Impact:** Remotely exploitable vulnerability that could allow an attacker to control vulnerable systems

**Advisory Impact:** Prevention

**Summary:** Microsoft Internet Explorer contains a vulnerability in the way select elements are parsed. The reported vulnerability could allow an attacker to execute arbitrary code on the users systems in the context of the logged-on user by enticing the user to open a specially crafted web site.

**Recommended Action:** Corero recommends the following actions:

Download and apply Protection Pack 2011-10-12-02 (or later) to put this new protection into place. This will put into place protection for the Microsoft Select Element Remote Code Execution Vulnerability that will be applied to the “Recommended Client Protection” IPS Rule Set.

In order to take advantage of the protection provided in this Protection Pack, make sure the IPS rule tln-106389 is enabled in the IPS Rule Set used to inspect traffic to your Microsoft Internet Explorer infrastructure.
